The FOPID gains and differentiation orders are optimally tuned in order to fulfill the robustness design specifications by solving a nonlinear optimization problem. A comparison to the conventional Proportional-Integral-Derivative (PID) and robust PID is also provided from ...

Fractional robust control of lightly damped systems

fractional differentiation. It permits the robust control of perturbed linear plants using the common unity feedback configuration. It consists on determining the nominal and optimal open-loop transfer function that guarantees the required specifications. This methodology uses fractional derivative orders (real or complex) as high level.

Robust stability of linear fractional systems with non ...

Abstract :-Using the differentiation and integration of fractional order or non-integer order in systems control is gaining more and more interest from the systems control community. In the present document, we study the stability of multivariable fractional systems using robust fractional controller.

cially order 1 used by the gradient and order 2 by the Laplacian [2,4,5,10,13,16,25,26,28,31]. In [20-23], the principles of non-integer order differentiation operators in edge detection is introduced. This paper demonstrates with details how using an edge detector based on fractional differentiation can improve the
